

The mission of the Vanderbilt Transplant Center is to advance the medical, social, and scientific aspects of transplantation through multi-specialty programs in patient care, research and education.

The Vanderbilt Transplant Center

has long been recognized as one of the nation's premier centers in transplantation. It is an exceptional, multi-disciplinary alliance of transplant specialists. The participants share a common interest in the efficient acute and long-term care of the patient through advances in immunosuppression, organ and tissue procurement, avoidance of complications and facilitation of social support.

Founded in 1989 as an organized full service center in transplantation, the Vanderbilt Transplant Center is located on two adjacent floors of the Oxford House building within the Vanderbilt University Medical Center community. This unique configuration promotes collaboration on clinical and research issues among the physicians, nurses and staff members of the Transplant Center.

The Transplant Center has extensive clinical experience in each of the established transplant programs, excellent clinical outcomes and experienced leadership. All Vanderbilt Transplant programs are Medicare approved. All programs have survival figures that surpass the national average.

Enhanced patient care and a better quality of life are provided to all transplant patients through the unique patient support services offered by Transplant Psychiatry, Ethics, Infectious Disease, Social Work, Pharmacy and the Return-To-Work Program.
