BURRELLE'S

Process treats lupus, doctor says

CHICAGO — Lupus, an incurable disease that turns victims' immune systems against them, has proved vulnerable to a new radical approach that destroys and then revives the body's natural defenses, doctors say.

A 24-year-old woman dangerously ill with the disease shows no signs of lupus in her system two months after the treatment, said Dr. Richard Burt of Northwestern Memorial Hospital.

Heather Markel, whose condition worsened recently after 13 years of treatment with steroids and chemotherapy, is the first patient to receive the treatment, Burt said Friday.

A medical student from Millersburg, Ohio, Markel contracted lupus when she was 11. The disease attacked her lungs, kidneys, blood and central nervous system, leaving her with failing kidneys and

soaring blood pressure when she came to Northwestern in January.

Since the stem cell transplant in April, Markel's kidneys have returned to normal, her strength is back and she has sharply lowered the amount of steroids she is taking.

"I think about what it would be like to be normal, not to take medicines," Markel said. "I don't know really what it's like to not go into the hospital every time you get sick."

Burt and others cautioned that it is still early for a definitive answer since the disease is characterized by active and inactive periods.

"We're just going to have to continue to follow her," Burt said. "This is much more than you would expect from a normal remission."

The disease turns a victim's immune system against their body. The worst cases attack the joints, tissues and organs. Symptoms range from arthritis, skin lesions and fatigue to heart attacks, strokes and kidney failure.

Many die from complications.
